

## Question E

### Valid Palindrome

Solved

Given a string *s*, return true if it is a **palindrome**, otherwise return false.

A **palindrome** is a string that reads the same forward and backward. It is also case-insensitive and ignores all non-alphanumeric characters.

**Note:** Alphanumeric characters consist of letters (A-Z, a-z) and numbers (0-9).

#### Example 1:

Input: *s* = "Was it a car or a cat I saw?"

Output: true

Explanation: After considering only alphanumerical characters we have "wasitacaroracatisaw", which is a palindrome.

#### Example 2:

Input: *s* = "tab a cat"

Output: false

Explanation: "tabacat" is not a palindrome.

#### Constraints:

- $1 \leq s.length \leq 1000$
- *s* is made up of only printable ASCII characters.

```
import string

class Solution:

    def isPalindrome(self, s: str) -> bool:

        x = s.replace(" ", "").upper()

        x = ''.join(filter(lambda ch: ch not in string.punctuation, x))

        # print("fffff",str(c))

        print('ggg',x)

        print(len(x),len(x)/2)

        print(len(x)-1)

        print(string.punctuation)

        for i in range(int(len(x)/2)):

            if x[i] != x[(len(x)-1) - i]:

                print(x[i], x[(len(x)-1) - i])

                return False

        return True
```
